ACKNOWLEDGEMENT

The following pages are devoted to a selection of modern sculpture from the Joseph H. Hirshhorn Collection.

Mr. Hirshhorn owns one of the finest and most extensive collections which includes historic objects drawn from ancient western civilizations and from primitive cultures, as well as a distinguished group of paintings.

It is, however, his large and unique group of modern sculpture that has gained for Joseph H. Hirshhorn the respect, the admiration and the envy of art conscious people throughout the world. An important part of it—the largest to have been publicly presented—is the subject of this exhibition and book.

The presentation of "Modern Sculpture from the Joseph H. Hirshhorn Collection" is an event of great importance for which The Solomon R. Guggenheim Museum is most grateful.

Harry F. Guggenheim, President

To accommodate the exhibition within the available museum space and to arrive at a harmonious interplay between sculpture and architecture are obvious aims that have determined selection and presentation of MODERN SCULPTURE FROM THE JOSEPH H. HIRSHHORN COLLECTION at The Solomon R. Guggenheim Museum. The ampleness of the collection far exceeds the capacity of the Museum's exhibition space even with the scope limited to the modern era and the medium to sculpture. Since reductions beyond this point became necessary these were approached with the intention to preserve the balance and the emphasis, the range and the personal bias that distinguish the collection as a whole. Daumier, Degas, Manzù, Moore, Lipchitz, Smith and other favorite sculptors of Mr. Hirshhorn form islands of great concentration in the collection and are therefore also represented in depth in the Guggenheim selection. The balance between the collection's already classic portion with Rodin, Bourdelle, Renoir and Matisse, to name but a few of the old masters, and Mr. Hirshhorn's demonstrated commitment toward the little known and experimental — a balance fundamental to the collector's intentions — was also an element to be preserved at all cost in the reduced exhibition version.

Finally, selection and presentation were determined by the Guggenheim Museum's educational orientation, an intent to relate, as far as possible, the visual substance of a work of art to its broader historic and stylistic framework.

The presentation of MODERN SCULPTURE FROM THE JOSEPH H. HIRSHHORN COLLECTION at The Solomon R. Guggenheim Museum required a large collective effort involving the complete Museum staff. The entire undertaking was also dependent upon the diligent and informed contributions made throughout the project by Mr. Abram Lerner, Curator of the Joseph H. Hirshhorn Collection.

Thomas M. Messer, Director

FOREWORD

ABRAM LERNER, Curator of the Joseph H. Hirshhorn Collection

The present exhibition of 444 works of modern sculpture from the Hirshhorn Collection is the first comprehensive showing of sculptures from the Collection. Three years ago the Detroit Institute of Arts exhibited 230 pieces and subsequently 110 of these were shown in museums in the Middle and Far West. The response was enthusiastic and made all the effort worthwhile, but it was disappointing that New York had no opportunity to see this exhibition. When the Trustees of the Guggenheim Museum suggested a much larger and more comprehensive presentation which would offer an even broader survey of modern sculpture, we were delighted to cooperate. The result of the collaboration is the present exhibition.

Since the text of this book will deal fully with the sculpture, perhaps a few notes on the Collection are in order.

Joseph H. Hirshhorn started his Collection about 30 years ago. Freedom of action, which would seem to be a cornerstone of Mr. Hirshhorn's personality, is also characteristic of the private collector. This degree of independence is usually not available to most curators and museum directors who are responsible to their trustees, budgets, patrons, and history. There is nothing to deter the collector from exercising his own prejudices and enthusiasm as long as he can afford them. In consequence, the private collection has a unique individuality—extravagant in some ways, reserved in others. It also has a unique function in that it can complement the historically oriented and carefully balanced museum collection by its willingness to emphasize particular artists or movements, and to welcome the very old or very new with equal ardor. It is free to move in any direction and the degree to which it profits from such autonomy is often the index of its quality.

The Hirshhorn Collection never aimed at an all-inclusive historical survey of sculpture. It was and is primarily guided by Mr. Hirshhorn's own inclinations and sensibility, as well as a passion for collecting which has long since passed the point of utilitarian need. He most truly fits Sir Herbert Read's definition of a collector as ". . . abnormal, a greedy lover of beauty."

When Mr. Hirschhorn acquired his first sculpture, a piece by John Flannagan, he undoubtedly felt he was merely adding to his collection a somewhat different kind of art object, one that would complement the paintings and extend his range of interest. It was his intention to bring additional American pieces to the painting collection which was, and still is, essentially American. In time it became evident that the limited creation of sculpture, in contrast to the relatively enormous output of modern painting, made it practical and desirable to add pieces from all over the world. With great insight Mr. Hirschhorn began to collect his sculpture at a time when fine pieces were available and interest in them negligible.

In the late thirties and early forties there was only mild tolerance of the medium. It was collected by a handful of people and even this small patronage was chiefly of sculpture of international reputation. There were a few dealers who nevertheless persisted in bringing fine sculpture to the public. One of these dealers was Curt Valentin, to whom the revival of interest in sculpture in this country owes a great debt. It was always a marvelous experience to visit his surprisingly small quarters and find beautiful examples of modern sculpture overflowing from the galleries into the outer halls. For the collector who was perceptive, such exhibitions were invaluable lessons in the history and appreciation of sculpture. Joseph Hirschhorn was such a collector, and whenever I accompanied him to the Valentin Gallery, I knew that he would be unable to resist acquiring at least one piece out of the many beautiful things there.

One of the characteristic things about Joseph Hirschhorn is his sustained interest in an artist's development. Having bought his first Henry Moore he could not resist adding new Moorses as they came to his attention. He showed the same persistent interest in Matisse, Giacometti, Epstein, David Smith, Manz and others.

Obviously Joseph Hirschhorn loves sculpture and has an eye for its best qualities. In the presence of a fine piece he cannot conceal his enthusiasm. Dealers here and abroad will testify to this glow which is a prelude to battleship brown on such occasions and which, sooner or later, results in a transfer of ownership.

Something about the palpable nature of sculpture, its physical presence and plasticity, moves a special appeal to him. There is an ambiguity, a mystery, a naive poetry, that delights him and invites his interest and curiosity. This has been accompanied by an equally restless acquisitiveness, a growing inventory of his journey in appreciation and experience. As keeper of this great treasure, I wish to express my pleasure in seeing it made available to the public.

I cannot praise too highly the fine spirit that motivated this exhibition. Mr. Horn, J. Guggenheim, President, and the Trustees of The Solomon R. Guggenheim Foundation were receptive and enthusiastic from the start, and they have our thanks for making the exhibition possible and available to the people of this city. Mr. Thomas M. Messer has listened and acted on the occasion with the brilliance that has become characteristic of his efforts in the past. Mr. Horn's program has produced the book and written an illuminating comment on the history and development of modern sculpture. We cannot be grateful enough to the staff of the Museum and I especially wish to thank Mr. Denise Robbins, whose intelligent and enthusiastic cooperation is due to the excellence of the exhibition and this book.

MODERN SCULPTURE IN THE JOSEPH H. HIRSHHORN COLLECTION

The Joseph H. Hirshhorn Collection of Modern Sculpture is perhaps the most comprehensive collection of modern sculpture in existence. Comprising between seven and eight hundred works, many of monumental scale and importance, it traces with few omissions the entire development of sculpture from Rodin to the present day. It is remarkable not only for its general quality and the extent of its coverage, but also for its examination in depth of many of the major masters. Some statistics will suggest the degree in which this is true. These statistics cannot be precisely accurate, because even as they are quoted, new works are in process of being added. Daumier, the one sculptor of the earlier nineteenth century who intrigues Mr. Hirshhorn, is represented by some 37 pieces. Rodin is represented by 14 works including a major cast of *The Burghers of Calais*. There are 7 Rossos, 5 Bourdelles, 11 Maillols, 17 Degas, 6 Renoirs, 10 Picassos, 12 Matisse, 9 Arps, 9 Duchamp-Villon, 13 Lipchitzes, 17 Giacomettis, 11 Marinis, 26 Manzùs, and 51 Henry Moores. Other leading sculptors such as Brancusi, Laurens, Lehmbruck, Archipenko, Hajdu, and Hepworth are each represented by several examples.

Equally impressive is the coverage of newer directions in European and American sculpture. Mr. Hirshhorn is constantly looking at and buying the works of younger sculptors. There is probably no collection, public or private, which contains so thorough a representation of the newest experiments in the sculpture of today.

The comprehensiveness of the collection has suggested the form of the present book. It is arranged as a picture history of modern sculpture, with the illustrations placed in a generally chronological order by artist, movement, and country. The brief commentary, accompanying the illustrations, attempts in available space to suggest some of the problems with which sculptors have been concerned, and to describe some of the characteristics of the works illustrated. No attempt has been made to discuss every artist or every work of art. However, the grouping of artists and works in the illustrations will emphasize their particular stylistic directions.

Biographies of the artists and the checklist of the exhibition are arranged alphabetically after the illustrations. These are followed by a selective bibliography.

COMMENTARY

H. H. ARNASON

Sculpture in the twentieth century has emerged as a major art for the first time since the seventeenth century. Its development in the last sixty years is even more remarkable than that of twentieth century painting. The revolution of modern painting was achieved against the background of an unbroken, great tradition extending back to the fourteenth century. In the nineteenth century, despite the prevalence and the substantial role played by lesser academicians, painting remained the single, great visual art, producing during the first seventy-five years masters such as Goya, David, Ingres, Géricault, Delacroix, Blake, Constable, Turner, Corot, Courbet, and Manet. The leading names in sculpture during this same period were Canova, Thorwaldsen, Rude, David d'Angers, Barye, Carpeaux, Dalou, Falguière, and Meunier. Of these only perhaps Carpeaux has a continuing reputation, and he more on the basis of his sketches than for his sentimental genre or monumental decorative works. The sculpture of Daumier, now much admired, was a private art, little known or appreciated until its rediscovery in the twentieth century.

The eighteenth century was also an age of painting rather than sculpture. During that century only the sculptor Jean Antoine Houdon may be compared with painters such as Watteau, Boucher, Fragonard, Guardi, Tiepolo, or Goya. The seventeenth century, and then principally in the person of Bernini, was the last great age of sculpture before the twentieth. In the United States, with the exception of one or two men of originality and high competence, such as St. Gaudens, sculptors were only secondary figures from the beginning of our history until well into the twentieth century.

When we consider the dominant place which sculpture has held in the history of art from ancient Egypt until the seventeenth century of our era, this decline is all the more remarkable. The decline was not for want of patronage. Although the eighteenth century provided fewer monumental public commissions than the Renaissance or Baroque, the nineteenth century saw mountains of sculptural monuments crowding the parks and public squares or adorning the architecture of the period. By this time, however, academic classicism had achieved such a rigid grip on the sculptural tradition that it was literally impossible for a sculptor to gain a commission or even to survive unless he conformed. The experimental painter could usually find a small group of enlightened private patrons. However, the very nature of the sculptural medium and the tradition of nineteenth century sculpture as a monumental and public art made this more difficult for the sculptor.

RODIN

This was the situation until the third quarter of the century, when Rodin emerged on the scene. It is the achievement of Rodin almost single-handed to have recharted the course of sculpture and to have given the art an impetus that was to lead to a major renaissance in the late nineteenth and twentieth centuries. There is no one painter, not even Courbet, Manet, Monet, Cézanne, Van Gogh or Gauguin who quite occupies the place in modern painting which Rodin occupies in modern sculpture. He began his revolution, as had Courbet in painting, with a reaction against the sentimental idealism of the academicians, through the closest return to nature. *The Man with the Broken Nose* (1864) (No. 387) was rejected by the Salon because it was offensively realistic. The re-examination of nature was coupled with a re-examination of the art of the Middle Ages and of the Renaissance, most specifically Donatello and Michelangelo. Although much of academic sculpture paid homage to the High Renaissance, it was the High Renaissance seen through centuries of imitative accretions which largely concealed the original works. Rodin looked at Donatello and Michelangelo as though they were masters of his own time to whom he was apprenticed, and thus he achieved the anomaly of turning its own gods against the academic tradition.

The achievement of Rodin in the liberation of modern sculpture is one of degree rather than of kind. It is possible to find prototypes or analogies among his contemporaries for his treatment of subject matter, space, volume, movement, light, and material. However, in no other sculptor of the nineteenth century are all the elements and problems of sculpture attacked with comparable energy, imagination, and invention. In no other sculptor can be found such brilliant solutions.

The basic medium of expression of sculpture from the beginning of time until the twentieth century has been the human figure. It is in terms of the figure, presented in isolation or in combination, in action or in repose, that the sculptor has explored the elements of sculpture—space, mass, volume, line, texture, light, and movement. Of these elements, volume and space and their interaction have been traditionally the primary concern of the sculptor. In terms of this interaction, the history of most of the great periods of sculpture may be written. If the cycles of Classical Greek and Hellenistic sculpture, Romanesque and Gothic, and Renaissance and Baroque, are traced, in all three may be observed a comparable development from the early or archaic frontality to the ultimate stage of figures existing as articulated, three-dimensional masses in fully realized three-dimensional space. With the exception of certain works of Bernini such as the *Ecstasy of St. Theresa*, the final solution of most of the cycles of sculptural history has characteristically involved the figure as a relatively coherent central mass revolving in, and in some degree interpenetrated by surrounding space.

The greater sense of spatial existence in Hellenistic, Late Gothic or Baroque sculpture also inevitably involved an increased sense of implied movement, achieved by the twisting pose, the extended gesture, or frequently by a broken, variegated surface texture whose light and shadow accentuated the feeling of transition or change.

The Baroque feeling for spatial existence and movement was part of the nineteenth century sculptural tradition, particularly in the monumental works of Carpeaux and Dalou; and Rodin was in possession of the full range of historic sculptural forms by the time he returned from his brief visit to Italy in 1875. *The Man with the Broken Nose* of 1864 was already a mature and accomplished work suggesting the tragic intensity of the artist's approach to subject as well as his uncanny ability to suggest simultaneously the malleable properties of the original clay and the light saturated tensile strength of the final bronze material.

The Crouching Woman (1882) (No. 390) is one of the many individual figures inspired by the experiments of *The Gates of Hell*,¹ on which Rodin had begun to work in 1830. *The Gates* themselves, which occupied the artist until his death in 1917, and even then had not reached a final form, suffer from the very fertility of the ideas and the variety of the forms with which they are crammed. Nevertheless they are of the greatest significance in the artist's later career and in the history of modern sculpture. Saturated as they are with literary symbolism to the point where they almost cease to exist as any sort of sculptural totality, they nevertheless contain a vast repertoire of forms and images which the sculptor developed in this context and then adapted to other uses. The turbulence of the subject involved inspired him to the exploration of expressionist violence in which the human figure was bent and twisted to the limits of endurance, although with remarkably little actual naturalistic distortion.

The violent play on the human instrument seen here was a natural preamble to the expressionist distortions of the figure which have developed in the twentieth century. An even more suggestive preamble is to be found in the basic concept of the entire subject of *The Gates* — the concept of flux or metamorphosis, in which the figures emerge from or sink into the matrix of the bronze itself, are in process of birth from, or death and decay into a quagmire which both liberates and threatens to engulf them.

The Crouching Woman looks at first glance like an extreme of anatomical distortion. Actually, there is little distortion involved, and the pose, which could have been ugly or ludicrous, achieves in Rodin's hands a beauty that is rooted in intense suffering. The figure, a compact, twisted

¹ Rodin Museum, Paris.

mass, is wonderfully realized in and expressive of surrounding space. The powerful diagonals, the enveloping arms, the broken twist of the head, all serve both an expressive and a formal purpose, emphasizing the agony of the figure and carrying the eye around the mass in a series of completely integrated views.

The *Iris* (1890-91) (No. 392) achieves an even greater violence of pose, carrying the sensuality which characterized so many of the later figures to the point of brutality. The headless, one armed torso, by its maimed and truncated form, reaches a height of expressive vitality. The *Iris* is probably a sketch, but one which arrived in this form at a completeness to which nothing could be added. The sketches of Rodin in their rough immediacy and directness have a natural appeal to the twentieth century artist. However, their presentation in posthumous casts, as finished works of the artist, tends frequently to distort his actual intention.

The portrait sculptures of Rodin represent a chapter in themselves in their search for personality or for symbol statements. The *Balzac* in its final form was an exploration of the nature of genius, expressed through the means of sculptural "impressionism." The many preliminary versions, on the other hand, represented various attempts to recreate the appearance and the personality of Balzac and gradually from these sketches to approach a generalized statement. (Nos. 393, 394) Whether the final *Balzac* is or is not a success purely as a sculptural form, it is perhaps the closest approximation of nineteenth century sculpture to a purely abstract symbol.

If, of Rodin's sculptures, the *Balzac* most closely approximates some of the ideals of twentieth century expressionist sculpture, *The Burghers of Calais* (1884-88) (No. 391) sums up most successfully his transformation of the past into a monument that is both contemporary and personal. The debt of the *Burghers* to the fourteenth and fifteenth century sculptures of Claus Sluter and Claus de Werve is apparent, but this influence has been combined with an assertion of the dignity of the common man, analogous to the sculptures of Meunier. The rough-hewn faces, the powerful bodies, the enormous hands and feet transform these burghers into laborers and peasants and at the same time greatly enhance their expressive power. The tendency of Rodin to dramatic gesture is also apparent here, and the theatrical element is emphasized by the highly unorthodox organization, with the figures scattered about the base like a group of stragglers wandering across a stage. The informal, open arrangement of the figures is actually one of the most daring and original aspects of the sculpture. It is a direct attack on the entire classical tradition of closed, balanced groupings in monumental sculpture. The detached placing of the masses gives to the intervening spaces an importance which for almost the first time in modern sculpture reverses the traditional roles of solid and void, of mass and space. Space not only surrounds the figures but completely interpenetrates the group to create a balance which anticipates some of the most revolutionary innovations of twentieth century sculpture.

Rodin: 93 B. *The Thinker*, Detail: Head

Maillol, also one of the major figures of early modern sculpture, began his career as a painter. At the opposite extreme from the violent variety of Rodin, he concentrated his whole attention on a restatement of the classic ideal of sculpture, stripped of all the academic accretions of sentimental or erotic synthetic idealism, and brought down to earth in the homely actuality of his models. Concentrating almost exclusively on the subject of the single female figure, standing, sitting, or reclining, and almost always in repose, he stated over and over again the fundamental thesis of sculpture as integrated volume, as mass surrounded by tangible space. At the same time, the nudes of Maillol always contain the breath of life, a healthy sensuousness which reflects the living model rather than any abstract classical ideal. (Nos. 243-251)

Medardo Rosso also began as a painter and in his sculpture, he, in a sense, always remained a painter. Even in his most impressionist works, Rodin never entirely abandoned his sense of sculptural mass. Thus it is perhaps wrong even to refer to him as an impressionist. Rosso, on the other hand, deliberately dissolved the sculptural forms until only an impression remained. His favorite medium of wax allowed the most imperceptible transitions so that it becomes difficult to tell at exactly what point the wax becomes the face or the figure. Form is dissolved into amorphous shape and light-filled, vari-textured surface. The very subjects, detailed genre scenes, conversation pieces, stretch the limits of traditional sculpture. Still, in his freshness of vision, his ability to catch and record the significant moment, Rosso added a new dimension to sculpture and anticipated the search for immediacy which characterizes the experimental sculpture of our own day. (Nos. 403-409)

Antoine Bourdelle, like Maillol, sought a revitalizing of the classical tradition. However, his approach involved an eclectic, somewhat archaeological return to the spirit and forms of archaic and early fifth century Greek sculpture, as well as to those of Gothic sculpture. A youthful portrait bust, *La Marquise* (1886) (No. 35) has a serenity which is both classic in feeling and reminiscent of portraits by Houdon. The *Warrior* (No. 37) from the *Monument to the Fighters* at Montauban (1873-1896) represents the moment of greatest indebtedness to Rodin, and with all its immense power of gesture points to the danger of an attempt to out-Rodin Rodin. This could only lead to theatricality, a danger from which Bourdelle was rescued by his conscious return to antiquity after 1900. The *Head of Apollo* (1900) (No. 36) is a key work in this return, combining as it does a consciously archaic quality with vitality which makes it more than a mere eclectic adaptation of antiquity.

The torso of the figure called *Fruit* or *Pomona* (1911) (No. 33) relates mass and spatial existence to a flowing, linear movement of contour. Although this work and others of Bourdelle's female nude figures may be compared with Maillol, they are always clearly individual in their restless activity achieved through the accent on moving outlines.

The most immediate inheritor of the tradition of Maillol was Charles Despiau, a limited but sensitive artist. His figure studies achieve a repose, a withdrawn elegance which transcends even that of Maillol, and his portrait heads have the reticence of utmost simplification in modelling, the elimination of all extraneous details. (Nos. 126-128)

Maillol: 251. *Nymph*.

Despiau: 123. *Portrait of Mme. Derain.*

Despiau: 126. *Mlle. B. (Blanchini).*

One of the most indicative symptoms of the revival of sculpture at the end of the nineteenth century is the number of important painters who practiced sculpture. Gauguin, Degas, Renoir, Bonnard were among them, followed in this century by Picasso, Matisse, Modigliani, Braque, Derain, Léger, and many others. Maillol and Rosso were both first painters before they became sculptors. The pioneer sculptor-painter of the nineteenth century was Daumier, who lived between 1810 and 1879. Most of his wonderful caricature heads were created in 1830-32 and anticipate late Rodins in the directness of the deeply modelled surfaces. (Nos. 65-81) *The Ratapoil* (1850) (No. 82) is a completely realized sculpture. The arrogance and tawdry elegance of the pose is presented in terms of spatial existence and movement in which the fluttering, light-filled flow of the clothes acts as counterpoise to the bony armature of the figure itself.

The sculpture of Daumier is a prototype but not an influence for the beginnings of modern sculpture, since it was little known by the sculptors of the first generation. The same is true of the sculpture of Degas, most of which was never publicly exhibited during his lifetime. Degas is unquestionably the greatest of the late nineteenth century sculptor-painters. His sculptures were conceived in sculptural terms, concerned with the fundamental formal problems of sculpture. Both his horses and his dancers represent continual experiments in space and movement. The posthumous bronzes retain the sense of the original wax material, built up, layer by layer to a surface in which every fragment of wax is clearly articulated. The genre scenes, such as *The Masseuse* (1896-1911) (No. 110), seem at first to be curious translations of genre painting into sculpture. However, they also, on closer analysis, assert a sculptural mass in a complex spatial interplay. (Nos. 102-113)

Renoir's sculptures, created towards the end of his life, are more directly translations of his late paintings. Since, however, these paintings strongly emphasize sculptural modelling of the figures, the translation is a logical and natural one, and the sculptures emerge as simplified, classically massive figures in repose or in slow movement. The tradition is that of late antiquity seen through the classic peasants of Maillol, the accent on sculptural mass in repose rather than of space or movement. (Nos. 375-379)

Degas: 107. *Dancer, Arabesque Over Right Leg.*

GERMANY

Wilhelm Lehmbruck, who worked in Paris between 1910 and 1914, also showed in works like the *Torso* (1910-11) (No. 233) the influence of Maillol. However, the tragic face of this figure reflects a personal expression which becomes more explicit in the great *Kneeling Woman* (1911).² The *Head of a Girl* (1913) (No. 234) and the *Inclined Torso* (1913) (No. 235) illustrate the Romanesque elongation which Lehmbruck used for the suggestion of inward suffering. These are works of delicate power, withdrawn and filled with a spirit of melancholy, works in which the contour line assumes a major significance in the definition of the volumes of the figure. The elongation of these figures, which is presented with such natural ease that it does not seem like distortion, represents a major break from the control of realistic proportions.

The German expressionist sculptors represented a wide variety of points of view although in general they did not depart very far from nature in the direction of expressive distortion or of abstraction. Barlach looked back for his sources to German medieval art as well as to the folk art of Germany and Russia. His fondness for groups of interacting figures is suggestive of the wood carvings of peasants. These are sculptures of simple yet strongly felt emotion—love, suffering, anger, humor, stated with the broadness of caricature, in terms of highly simplified sculptural masses frequently expressing their emotions in terms of a single, encompassing movement of the mass. (Nos. 22-26)

Käthe Kollwitz, although best known as a graphic artist, attained in her sculpture a profound sense of sculptural mass as an expressive medium. Her relief sculptures are compact, massive fragments, filled with feeling which is both intensified and controlled by the economy of the means. The *Pietà* (1933) (No. 221) transforms the intertwined figures into a solid pyramid of closely integrated forms whose density heightens the passionate expression of grief and suffering.

Gerhard Mareks continues Barlach's earthy quality of humor in groups, animals, and single figures. The *Seated Girl* (1953) (No. 276) and *Girl with Braids* (1950) (No. 275) whose blocked out, heavy featured, peasant faces have all the naive charm of German medieval sculpture, achieve in the figures an awkward adolescent grace, presented with overtones of cubist control.

The scene of the major revolution in modern sculpture, like that in modern painting during the first years of the twentieth century, was Paris. One of the first great figures was Brancusi, an artist who created no school, but who strongly affected the course of subsequent sculpture. Although the development of his sculpture traces a continuing search for the essences of forms which was a continuing reaction against the complexity and literary subject of Rodin, Brancusi still admired Rodin and admitted him to be the master of the new sculpture. His own sculpture, however, moved constantly towards an intensive examination of a few, fundamental forms in terms of which he sought to define the nature of sculpture itself.

A Rodinesque *Sleeping Muse* (1906),³ whose naturalistic features emerged imperceptibly from the unshaped marble, became the *Sleeping Muse* (1909-11) (No. 39), an egg-shaped form with sharply delineated features repeating the ovoid contours, balanced lightly on a flat plane. This in turn became the teardrop *Prometheus* (c. 1911) (No. 40) with features almost disappearing into the volume of the head. The process of simplification was continued in subsequent works until all extrusions were eliminated and there remained an egg shape to symbolize not only the beginning of the world but in a specific sense the beginning of sculpture.

In his search for essences, Brancusi pointed the way for twentieth century sculptors. He was never really an abstractionist, because there was always in his works a subject idea, reduced to a single fundamental. Thus, birds became the idea of flight; fish, the motion of swimming; a cock, the cock's comb or the cock's crow.

The simplification of forms involved not only the essential statement of a subject, but the essential statement of the nature of materials and of the nature of sculpture itself. For Brancusi the nature of his materials must be stated without qualification. In the early archaic heads and figures the rough block of the stone defines the image. The marbles and bronzes emphasize the curving forms with a finish of the highest polish. The finish is further emphasized by contrast with bases of rough stone or roughly hewn wood. (*Torso of a Young Man*, 1921) (No. 11) The great wooden totems remain tree trunks shaped with the axe.

All the sculptures of Brancusi are, finally, statements in their essences of masses and volumes existing in and defining three-dimensional space. Thus, in form, content, and materials, Brancusi liberated sculpture from the literary illusionism of the nineteenth century. Rodin enlisted their own classical gods in his fight against the academicians. Brancusi refined the classical ideal to its ultimate essence.

³ Not in exhibition

Brancusi; 11. *Torso of a Young Man*.

Although his contribution was a unique one and throughout his life he seems a curiously isolated figure, Brancusi was not alone in his search for absolutes. The revolutions in painting of post-impressionism, fauvism, and cubism were accompanied by comparable revolutions in sculpture. In painting, the cubists, beginning in 1907 with Picasso and Braque, sought to destroy finally the Renaissance concept of a painting as an imitation of the natural world, as a window opening out into naturalistic space. They wished to assert for the painting its own identity, its own pictorial space arising out of its own physical nature as a flat canvas surface to which pigment is applied. Their explorations led Braque and Picasso first to geometric, Cézanne-like landscapes, then to highly sculptural figure studies. By 1910, three-dimensional, sculptural modelling had disappeared, the color had been deliberately subordinated to a close harmony of greys, browns, and greens, and the subject (figure or still life) had been transposed into a linear geometry of intersecting and frequently transparent planes, a sort of 'grid' moving within a confined depth from the frontal plane of the painting.

In sculpture the problem was a comparable search for the fundamentals of sculptural form through stripping off all the illusionistic accretions of the Renaissance tradition. Brancusi was carrying on his similar explorations but they were not as familiar to the younger experimental sculptors as were the cubist innovations of the painters. Cubism, with its strict geometry of spatial analysis, seemed immediately applicable to the problem in sculpture, and was quickly adapted. The first cubist sculptors were affected not only by cubist painting but, like the cubist painters, by the discovery of African primitive sculpture. Picasso's *Head of a Woman* (1906) (No. 366) in the brutal geometry of the features shows in sculpture the same debt to African sculpture as is to be found in the paintings of 1907 and 1908. His *Head of Fernande Olivier (Cubist Head)* (1909) (No. 368) is a literal translation into sculpture of a cubist painted head. The *Head of Fernande Olivier* is most important historically as the first cubist sculpture. However, some question may be raised in what degree the deep, geometric faceting of the surface actually enhances or clarifies the sculptural form.

The same question may be asked concerning Archipenko's first cubist sculptures. There is no question that Archipenko was the pioneer cubist sculptor. In works such as the *Seated Female Nude* (1909) (No. 3) his use of a barely suggested geometric structure gives to the elegant revolving figure a firmness which prevents it from becoming purely decorative. By 1912, Archipenko had fully realized the implications of cubism for sculpture and had made contributions of the highest significance by opening up voids within the sculptured figure to the point where the historic concept of a sculpture as a solid surrounded by space was completely reversed. Now for the first time in

history, a sculpture became a series of voids or spaces shaped and defined by solid outlines. In 1913 Archipenko made another great contribution in adapting to sculpture the new technique of collage and beginning to make constructions out of different materials such as wood, glass, and metal. Although the *Medrano* figures which he constructed during the next few years tend as sculptures towards the mannered and the decorative, the technique which he devised was of immense importance in opening the way to the entire field of sculpture as construction, sculpture as space rather than as mass.

The artist of greatest unfulfilled talent among the first cubist sculptors was Duchamp-Villon, whose tremendous potential was cut off at his early death in 1918. However, the limited number of works he left behind are not only revolutionary in their exploration of new aspects of sculptural form, space and movement, they are in their own right sculptural masterpieces. The *Torso of a Young Man* (1910) (No. 131) uses cubist geometry to reiterate and strengthen a classic ideal of the figure. The *Head of Baudelaire* (1911) (No. 132) has the repose and classic structure of ancient Greek sculpture, achieved by the balance and extreme simplification of the features integrated into the strongly articulated skull. The *Seated Woman* (1914) (No. 137) combines a traditional twisting pose with integrated curves and planes to reach a complete three-dimensional spatial existence. This figure has now moved substantially towards abstraction, and the final step is reached in the great *Horse* and the *Head of a Horse* (1914) (No. 136). The various preliminary versions of *The Horse* such as *Horse and Rider* (1914) (No. 135) and *The Little Horse* (1914) (No. 138) trace the development of the idea from a flowing, curvilinear, relatively representational study to the complete abstraction of all elements into the final, powerful statement of diagonal planes, concave and convex shapes moving, unfolding and integrating space into the mass of the sculpture. Although their approach and their solutions are quite different, Duchamp-Villon sought the same essence as did Brancusi. By continually stripping away all extraneous details he came at last to complete sculptural experience. The portrait head became a mask of few related shapes, lines, volumes (*Head of Professor Gosset*, 1917) (No. 139); the recognizable *Horse and Rider* became the abstract space machine of the final *Horse*.

No other sculptor has explored the entire range of possibilities in cubist sculpture as has Jacques Lipchitz, and yet cubism is only one chapter in his extensive and brilliant career. In 1913 he introduced some geometric stylization into a series of figure sculptures; and by 1915 was producing a wide variety of cubist works in stone, bronze, and wood construction. The bronze *Head* (1915) (No. 237) is stripped down to a single rectangular mass penetrated by a few diagonal planes and concave accents. The *Bather* (1915) (No. 238) achieves attenuated elegance with vertical planes

accented by curved voids at top and bottom. The bronze *Reader* (1919) (No. 239) and the *Reclining Nude with Guitar* (1928) (No. 242) summarize his more massive and complicated cubism of the twenties which also involved an increasing accent on the expression of the subject. Lipchitz continued to use geometric structure in the monumental figure compositions of the thirties, but here the expressive content became paramount and gradually led to the free, baroque modelling of his later works.

The cubist sculptures of Henri Laurens retain generally a strong sense of the subject, whether still life or figure. The frequent use of color, beautifully and soberly integrated into low relief or free standing stone blocks, accentuates the relation between cubist painting and sculpture. Many of the cubist sculptors experimented with color, as the cubist painters sought relief effects with collage. Laurens' cubist works explore most particularly problems of mass in sculpture. By the late twenties his interest had shifted to the creation of volumes without mass and he had begun to compose in the curvilinear, moving rhythms of his later style. (*Maternity*, 1932) (No. 231)

Zadkine has never really deserted cubism, although from the very beginning his cubist sculptures took on expressionist overtones. The marble *Mother and Child* (c. 1913) (No. 438) illustrates the massive closed quality of his first works. Positive and negative spaces are interchanged and the whole is exceptionally tightly organized. However, the interest in the formal elements does not prevent an intense statement of the mother-child relationship, which makes of this essentially a subject sculpture. He has a particularly fine feeling for the quality of wood, and his wooden sculptures (*Female Torso*) (No. 440) retain the compact, living bulk of the tree form. His later sculptures move more and more to a mannered expression, involving elaborations of geometric and curvilinear shapes. (*Standing Figure*, 1925-28) (No. 439) Although the figures are constructed out of a vast variety of semi-architectural fragments, solids interpenetrated by voids, lines playing over surfaces, they are still essentially human figures, actors—gesturing, writhing and suffering.

Cubism was one of the greatest liberating forces for sculpture in history. It opened the path to new subjects other than the human figure; it led the way to complete abstraction; it defined the nature of sculpture as an art of mass, volume, and space; and it developed new possibilities in the utilization and expansion of these elements.

Although working independently of the cubists, Otto Freundlich developed a monumental sculpture of comparable simplified, regularized masses, as early as 1912. A similar and highly impressive use of regular cubic or cylindrical masses is the building up of monumental figures by the Austrian, Wotruba (*Figure with Raised Arms*, 1956-57) (No. 437). Even closer in spirit and forms to Freundlich is the Argentine sculptor, Alicia Penalba. (*The Sparkler*, 1957) (No. 361)

Of the twentieth century sculptor-painters, Matisse has perhaps made the most consistent statement in sculptural terms. His *Bust of a Woman* (1900) (No. 289) uses an impressionist play of light over the entire surface to create a curious and ambiguous sense of character; and thus is still close to an effect that is painterly. However, the *Slave* (1900-03) (No. 290), inspired by Rodin's *Walking Man*, is a solid and powerful sculptural mass whose deeply modelled surface accentuates the mass. Works like the *Decorative Figure* (1903) (No. 291), the *Large Seated Nude* (1907) (No. 296) and *Reclining Nude* (c. 1919) (No. 298) use the classical contraposto, the twisting pose of the figure, to create spatial existence, in a manner reminiscent of the late Renaissance. The *Two Negresses* (1909) (No. 297) again employs a traditional motif popular in the Renaissance, of showing the figure front and back, in a group of the greatest structural strength. The sculptures of the late twenties and thirties continue to express space through the twist of the figure, and, eliminating or subordinating surface, light, texture, reach an even greater degree of expression of the sculptural mass. (*Reclining Nude No. 2*, c. 1929, and *Venus in the Shell*, 1931) (Nos. 299, 300)

The sculpture of Modigliani was influenced by Brancusi and by primitive or archaic art. However, he was able to absorb these influences into a highly personal expression in the elongated and spiritual heads whose volumes are so wonderfully expressive of the rough stone blocks from which they emerge. (Nos. 307, 308)

Picasso's sculptures throughout his life have been essentially brilliant adaptations of his paintings, becoming more or less sculptural in the degree that the pictorial experiments variously lent themselves to sculptural effects. From the *Head of a Jester* (1905) (No. 363), suggestive of the blue period figures, one can parallel his development as a painter, through the massive, primitive wood carvings of 1907, the *Head of Fernande Olivier* (1909) (No. 368), the cubist constructions of 1913 and 1914, the surrealist bronzes and constructions of the late twenties, down to all the figure fantasies of today. His incredible ingenuity has produced innumerable masterpieces in sculpture; in many constructions he has explored problems of sculptural space; he has made many of the most brilliant uses of the found object to create works of the most delightful fantasy; yet continually one is brought back to the source of the sculpture in his painting or graphic work. (Nos. 363-371)

Braque, Derain, Léger, de la Fresnaye, Bonnard, Vallotton and many other painters of our time have produced important sculptures. The contribution of the painter to modern sculpture is very great, in large part because he approaches sculptures from a fresh and non-sculptural—in the traditional sense—point of view.

During the first twenty years of the twentieth century many sculptors were moving inevitably to certain basic conclusions on the nature of sculpture. There was first the fact that sculpture forms no longer need be expressed through the human figure; and second that sculpture no longer need be a three-dimensional mass existing in surrounding three-dimensional space. Brancusi, while maintaining the tradition of the solid surrounded by space, translated the figure into an abstract shape of an essential simplicity which stated the fact of existence and movement in space with ultimate clarity. Archipenko and Lipchitz began to construct from materials of wood and metal to reverse the traditional relation of solid and void. The futurist sculptor, Boccioni, dissected and interpenetrated the solids to unite them inextricably with the voids and to put them in movement in space. Picasso's 1913 relief constructions adapted for sculptural spatial experiment the still lifes of cubist painting.

In 1913 also, the Russian, Tatlin, created purely abstract reliefs which were arrangements of planes projecting into and enfolding voids. In 1915, Naum Gabo, then in Norway, began constructing heads of sheets of wood, metal, or cardboard, in which the head became an arrangement of voids bounded by planes. The constructivist exhibition of 1920 and the Realist Manifesto issued by Gabo and his brother, Antoine Pevsner, drew the inevitable conclusion to which all these experiments had been leading. The Manifesto renounced volume and mass as primary sculptural elements and substituted depth as defined by planes or lines; it renounced the static rhythms of past sculpture and substituted 'kinetic rhythms as the basic forms of our perception of real time.'

Gabo pursued these ideas in Germany in the twenties and after 1946, in the United States. Pevsner, who had been first a painter, settled in Paris and turned to constructivist sculpture. Each developed his own characteristic style, but both have continued to explore their stated principles. With these men was born a new concept, one of the most influential in the history of sculpture. (Nos. 161, 362)

Cabo Del Este, Cuba, 1954

Fig. 302. *Construction in Space*

GONZALEZ**LIPCHITZ**

The constructivists and their followers developed the direction of geometric abstraction, frequently, as in the case of Gabo after 1920, using transparent plastic materials or string or wire constructions in order to destroy any sense of bulk and to make all forms and their relationships clearly apparent from any point. The search for a new definition of sculptural space was carried on in other ways by Julio Gonzalez, who as early as 1908 was working directly in wrought iron, thus initiating the technique of direct metal sculpture which has transformed the nature of sculpture in our own time. In the twenties, Gonzalez began to produce wrought and cut iron sculptures, techniques which led to a great series of abstracted fantastic figures of open construction in which the beaten and twisted metal was expressed with a strong sense of the rough power of the material. (Nos. 187-192)

In 1926 Jacques Lipchitz began to experiment with small open-work sculptures, modelled in wax and cast in bronze, but giving the effect of wire constructions. These also were important prototypes of the effects sought by many of the direct metal sculptors. In the late twenties Lipchitz produced some of his major cubist sculptures. At the same time he was moving away from specific cubism and beginning to explore new subjects which demanded new sculptural means. The monumental *Figure* (1926-30) (No. 211) is a tremendous primitive totem of overpowering presence. The *Joy of Orpheus* (1933) (No. 213) illustrates the new, free, baroque forms developed during the thirties, with rounded volumes opened up in hollows and voids, whirling ecstatically in space. Since 1930 Lipchitz has found an enormous repertoire of subjects in classic myths to which he has given new meanings for his own time. Through many of them may be followed the theme of metamorphosis, the idea of constant change and transition from one element to another. Thus *Europa* in her passionate embrace of the bull is absorbed into the godhead. (No. 214)

Lipchitz: 241. *Figure*.

Although Jean Arp was a founder of Dada, even his earliest collages and reliefs demonstrate an innate sensitivity to formal relationships which tended to override the sense of fantasy. When he began to do sculpture in the round at the end of the twenties, his seriousness of purpose as a sculptor became most apparent. Fantasy still persists down to the present day, frequently emerging in delightful elements of humor, but the serious and brilliant pursuit of the 'human concretion' is paramount. Arp belongs in the line of Brancusi, although the effects he seeks are entirely his own. Although, as he himself has said, all his sculptures are torsos, the torso is refined to a biomorphic shape, realized in space, solids and voids creating a sense of pulsating life which makes the figure move and change form before our eyes. This is a complete art of metamorphosis, of objects whose being is the act of becoming. (Nos. 9-16)

The tradition in sculpture stemming from Brancusi, of extreme purity, has strong followers throughout the world. Chauvin, working largely in isolation, has sought a limited perfection. Gilioli uses a geometric rather than an organic base, breaking up the beautifully polished marble block in precise rectangles or triangles, or controlling slightly curving pyramidal forms with sharply delineated contours. Hajdu, in his marbles, creates precisely and elegantly outlined profiles of suggested figures or flowers. (Nos. 57, 180-182, 197-201)

The element of fantasy, present in the works of Jean Arp, and in a highly different manner in Gonzalez and in many works of Picasso and Lipchitz, has been a continuing and ever increasing force in modern sculpture. The *Merzbau* of Schwitters and the *ready-mades* of Duchamp inaugurated a tradition of 'found object' sculpture which has reached a fantastic climax in younger sculptors of today. Most of the surrealists have tried their hand at sculpture. Miró has produced sculptured figures (*Personage*, 1953) (No. 305) as well as ceramics with all the appealing madness of his paintings. Max Ernst has in recent years turned increasingly to sculpture. Works like *Moon Mad* (1914) (No. 150) or *Mother and Daughter* (1959) (No. 151) present little Martian figures which can be menacing or funny and sometimes both.

The great master of fantasy in modern sculpture is Giacometti. The early works are surrealist dream creations in a specific sense, with strange objects scattered about a large plane, to establish a mood of haunting mystery in which space or emptiness becomes a sensation of overpowering loneliness. It is this quality which he has continued to seek in the sculptures of the last twenty years. In these, enormously elongated figures stand or walk in isolation, lost in a great void of the spirit. These are not fantasies in the sense of the deliberate shock practiced by the surrealists. They are, rather, tragic expressions of mankind suffering, isolated, and unable to communicate. (Nos. 165-176)

Germaine Richier created a world of monsters in bronze, whose pitted and broken surfaces take on the quality of lacerated and torn flesh, rotting and decomposing. These are yet very human and sympathetic monsters, capable of grief and suffering, and even at times of a clumsy, macabre humor. (Nos. 330-331) They are the ancestors of a whole generation of monsters who people the world of sculpture today. In France, the principal exponent of this tradition is César, whose *Nude* (1953) (No. 52) is simply a pair of legs with lower torso, horribly and wonderfully eroded and made more horrible by the curious sense of life which still remains. *La Maison de Davotte* (1960) (No. 51), built up out of fragments of scrap iron, is a huge structure, suggestive of a figure torso or a flattened out head in which the primary expressive element is the fantastic texture of the entire surface. Here the decay of the materials conveys a larger message of decay in which there is still a kind of order and beauty. César represents in a work like this the great international development of so-called 'junk sculpture,' sculpture assembled from any sort of found objects, old fragments of metal, the rubbish which slowly piles up at the edges of the modern industrial world. This rubbish is seen by these sculptors as part of the landscape of our society, a landscape of decay, destruction, and death, in which, nevertheless, there is a hope of revival, a new life, the creation of beauty from ugliness. Always present in this tradition is the idea of change, of metamorphosis as the controlling force of both the sculpture and of life itself.

César also experiments with a much more ordered and controlled sculpture. *Marseilles* (1960) (No. 53) is a great architectural, sculptural relief whose surface is built up of a large number of small, regular, shifting and overlapping planes, gradually compressing into a closely textured, vibrating central area.

French sculpture today continues to show variety and vitality. Paris continues to draw sculptors as well as painters from all over the world, so every international current is represented. The Dane, Robert Jacobsen, now creates bold and rough geometric construction in welded metal (*Movement in Acceleration*, 1957) (No. 213). The Swiss, Robert Müller, creates fantastic figure objects from hammered sheets of iron or steel (*Rittersporn*, 1953) (No. 336). Ipoustéguy presents primeval ritual figures in great, massive bronze casting in which the over-all finish is contrasted with roughly broken areas (*David*, 1959) (No. 212).

ITALY

Since the second World War, sculpture has received an enormous impetus not only in France and Germany but even more dramatically in Italy, England and the United States. The older artists in the new Italian sculpture had established reputations before the war, but in the last twenty years these reputations have become international. Manzù was influenced by Rosso but his real love is Donatello and the Italian Renaissance. The *Dancer with Skirt* (1956), *Dancer* (1954) and *Girl in Chair* (1955) (Nos. 261, 258, 259) are completely traditional works which have, nevertheless, a lightness and vitality which make them contemporary. The *Girl in Chair* (1955) particularly, with its introduction of the seemingly prosaic chair, illustrates the close study of nature in which the artist's works are rooted, and also the poetry which he is able to instill into the subject. The Cardinal series (*Standing Cardinal*, 1951) (No. 256) take a conventional subject and draw from it a mood of withdrawal and mystery, at the same time utilizing the heavy robes to create a simple and monumental sculptural volume. The sketches for the great series of religious reliefs for Salzburg Cathedral look back to Ghiberti as well as to Rosso in their free, impressionist handling, and to Della Quercia in the classic modelling and order of the individual groups. Manzù as a sculptor is an anomaly—a Renaissance artist who has established his place in the contemporary world, a traditional sculptor who is never academic.

It is perhaps one of the greatest strengths of modern sculpture as compared with modern painting, that even among experimental sculptors no one point of view is ever dominant to the exclusion of all others. The rise of abstract sculpture did not see an accompanying decline in figurative sculpture. Today throughout Europe and the United States may be found schools of realist, expressionist, abstract expressionist, abstract geometric, all flourishing and all contributing to the strength of the modern movement in sculpture.

Marino Marini was also an established and mature artist before the war, already experimenting with his favorite subjects including the horse and rider theme. His art is more violently

expressionist than that of Manzù, both in the distortion of the forms and in textural elaboration of the surfaces. The *Susannah* (1943) (No. 278) illustrates the solidly obese figure that he has continued to favor, the primitive modeling of the features on the surface of the head, and the textured surface, with paint worked into the gouges to add color and textural variety. The figures of the fifties became more angular, sometimes elongated, the naive, primitive element more pronounced, and the color, worked in an arbitrary series of geometric areas, is frequently a dominant note. (*Dancer*, 1954) (No. 282)

Marini is a brilliant portraitist. His portrait heads are all characteristic Marini heads, surfaces grooved, slashed, torn, and vari-colored, forms distorted, features exaggerated; yet they catch in an uncanny degree the expression and the personality of the sitter (*Curt Valentin*, 1953) (No. 281).

The horse and rider subject began to interest Marini in the late thirties and during the war it became for him a symbol for suffering and homeless humanity. The earlier versions of the forties are plump, sedate, and relatively relaxed, reminiscent of Chinese carvings of peasants on oxen. As he continues with the subject the action becomes more dramatic, the horse and rider more angular and attenuated. The horse, with elongated widely stretched legs and upthrust head, screams his agony. The rider with outflung stumps of arms falls back in a violent gesture of absolute despair. (*Horse and Rider*, 1950-53) (No. 279)

Many of the younger Italian artists in reaction against the reputation and influence of Manzù and Marini, have turned away from figuration and are working in various veins of free abstraction. Of these, one of the most impressive and original is Pietro Consagra, who creates in bronze and in wood, great plaques whose surfaces are penetrated and undercut to create a mosaic of strange shapes and suggested figures who have their life in an ambiguous depth behind the surface plane. (Nos. 58, 59)

ENGLAND

The postwar development of sculpture in England is even more phenomenal than that in Italy, since there had been produced in England very little sculpture of consequence between the Middle Ages and the twentieth century. The first major modern British sculptor (if the brilliant but tragically short-lived Gaudier-Brzeska is excepted) was Epstein, an American by birth, whose whole career was centered in England. In his stone carvings Epstein used a geometric simplification to emphasize the shape and the weight of the stone block in the creation of primitive images of brutal power. In his bronze figures and portraits the bronze reflects the highly fluid modelling and texturing of the clay. The *Visitation* (1926) (No. 147) is one of his masterpieces of religious sculpture, a beautifully and sensitively modelled figure, filled with a spirit of profound pathos. The portrait of *Joseph Conrad* (1924-25) (No. 146) illustrates his qualities as a portraitist. The texture of a relief map, the heavily undercut brows, the hooded, piercing eyes, the energetic, inquiring pose, all combine to give a sense of living personality.

Of present-day sculptors in England, Henry Moore is the dean and unquestionably the most fertile and creative mind. The early stone sculptures show influences from those of Epstein as well as from primitive African and pre-Columbian art. In the *Mother and Child* (1931) (No. 309) he has developed the more rounded treatment of the stone which is identified with him. The figures are carved with simple monumentality, the material of alabaster is strongly expressed, and the distortion of the enveloping left arm together with the small, primitive, alert head of the mother, gives to the group a compact structure and a definite emotional impact. In the early thirties, Moore turned to abstract forms and by opening up the masses and creating dispersed groups he studied various kinds of space relationships. Here started his continuing fascination with a sculpture of tensions between space and solid, between positive and negative spaces. These experiments were soon translated back into figures in which he opened up great voids which became the material of the sculpture, rather than the stone or wood. (*Family Group*, 1945) (No. 313)

The exploration of spatial problems led Moore in the forties and fifties to a greater use of bronze, in which material he could open up the figures to the point where the bronze was simply a frame, defining the forms of the voids. *Interior-Exterior Reclining Figure* (1951) (No. 315) is one of a series of intricate and subtle arrangements of solids and voids achieving a complete interpenetration. During the war Moore had made thousands of drawings of the underground air raid shelters. These inspired some of his most tender family groups and some of his most classic, restrained and monumental draped figures (*Draped Reclining Figure*, 1952-53) (No. 319). The early fifties brought forth new experiments in attenuated, angular 'bone figures'. The *King and Queen* (1952-53)

(No. 320) with their masks for faces, their flattened out, leaf-like figures, attain a sense of personality, of a regal dignity. The *Falling Warrior* (1956-57) (No. 330) is a macabre and tragic symbol of a world bent on destroying itself. In the mid-fifties, as well, Moore produced a series of 'Upright Motifs' of which the most notable is the *Glenkiln Cross* (1955-56) (No. 329), a gigantic and savage totem, which links the Christian symbol to the fertility columns of primitive mankind.

Moore, working with a relatively limited number of subjects—reclining figure, mother and child, family group—has yet attained an enormous range of expression in his sculpture. He has explored the entire range of sculptural forms and materials, and has always brought his explorations back to problems of humanity.

Although certain of her forms may derive from those of Henry Moore (her experiments with strings to balance and define the voids of certain sculptures of the fifties probably stem from similar experiments carried on by Moore in the forties) Barbara Hepworth really belongs to the tradition of Brancusi and Arp. Her search has been primarily for abstract, organic forms of the greatest purity which define basic spatial problems. *Pendour* (1947) (No. 205) attains great spatial variety within the simplicity of the total form, with white color being used to accentuate the voids. In some of her recent bronzes, such as *Porthmeor (Sea Form)* (1958) (No. 207) she begins to investigate freer shapes, more roughly textured, containing a suggestion of some living organism.

Moore and Hepworth stand somewhat aside from the younger British sculptors of the postwar era. Reg Butler has developed an impressive and highly expressive figure style, which has more in common with Marini and the Italians than it has with Moore. (*Manipulator*, 1951; *Girl*, 1954-56) (Nos. 16, 47) Armitage, Meadows, Chadwick, Frink explore their separate and highly individual problems of expression in bronzes of violent action or macabre repose. Paolozzi is the principal British exponent of the 'junk sculpture' or 'found object' school. Out of all the detritus of decayed machines he creates marvellous monsters of ferocious vitality, whose incredible agglomerative surfaces, reflecting in bronze the thousands of nuts, bolts, wires, and other machine parts, take on the pathetic beauty of a dying civilization (*Large Frog*, 1958) (No. 359). One of the most individual of the younger sculptors is William Turnbull, who creates out of a few massive elements of stone, wood, and bronze, sculptures of an elemental monumentality which take one back to the dolmens of Stonehenge (*Head*, 1957; *Hammerhead*, 1960) (Nos. 129, 130). The styles of these younger British sculptors have changed radically during the last ten years. In 1950, Butler, Chadwick, Paolozzi and Turnbull were all working in a linear, open type of metal sculpture, using generally abstract shapes.

Turnbull, 129 Head

UNITED STATES

Modern sculpture in the United States is so extensive and varied, and the Hirshhorn Collection is so rich in examples that only the briefest outline of some of the chief tendencies and figures can be attempted in limited space. America has also had her sculptor-painters. Thomas Eakins created accomplished genre sculptures; Max Weber experimented successfully with cubist sculpture. Larry Rivers and Jasper Johns are now working in the field of sculpture. (Nos. 140-143, 433, 385, 214)

Until the second World War, sculpture in the United States was plentiful but largely traditional. Of the pioneers, Nadelman of course was an international figure, trained in Europe. His sculptures alternate between the highly accomplished marbles and bronzes, combining an academic classicism with an *art nouveau* elegance; and the painted wooden figures, delightful puppet-like commentaries on the urban life of the early century. (Nos. 337-343)

Gaston Lachaise was also trained in Europe, although he came to America in 1906. His enormous, regal women, balanced on their slender legs and feet, seem at times to be almost caricatures of their Maillol origins. These are amazing figures, combining grotesque obesity with an incredible elegance of movement. (Nos. 222-228)

William Zorach is the dean of the traditionalists, an artist whose works have maintained qualities of simplicity and monumentality of the classic tradition. (*Eve*, 1951) (No. 444) In various modes, traditional figurative sculpture has been carried down to our own times by Maldarelli (*Bianca No. 2*, 1951) (No. 252), José de Creeft (*Dancer*, 1949-57) (No. 101), Chaim Gross (*Performers (See Saw)*, 1944) (No. 194) and Saul Baizerman (*Mother and Child*, 1931-39) (No. 19). Baizerman's technique of hammering figures from sheets of copper created, in serenely classical figures of the Maillol tradition, studies of volumes without mass. The hammered-out voids of the reverse become abstract sculptures in which space is the medium. Most of the leading American sculptors of the earlier generation were carvers in stone or wood. Of these, John B. Flannagan was outstanding in his ability to express subject and material so that they became inseparable. The *Mother and Child (Not Yet)* (1936) (No. 155) envelops the two heads and the mother's hand in a single, encompassing movement which gives all the essentials of the emotion expressed. The roughly textured surface of the grey fieldstone is not only stated as material, but serves to unify the figures into an entity. Flannagan's studies of little animals are sensitive translations into stone of an immediately caught and characteristic gesture or position. Flannagan, like Brancusi, was seeking essences. Without ever deserting representation, he sought continually for the simplest, most elementary and yet basic statement of the subject.

Reuben Nakian, who has developed into one of the most impressive and monumental of the direct metal sculptors, using geometric forms for expressive effect, was originally an outstanding figure sculptor (*Ecstasy*, 1947) (No. 344). A brilliant series of terra cotta incised reliefs translate his teacher, Lachaise, into high comedy (*Nymph and Cupid*) (No. 349).

The major international figure among American living sculptors is Alexander Calder, whose reputation is as great in Europe as it is in the United States, and whose works are known and enthusiastically collected all over the world. His wire circus figures and portraits of the twenties are

delightful toys and are also important in the development of new sculpture forms, since they literally are direct metal sculptures in which the metal wire is used to define the voids which are the primary forms. He is thus a pioneer in the concept of sculpture as space. With the invention of the abstract mobile in the early thirties, he incorporated actual rather than implied motion as a central element for sculpture. The earlier mobiles owed much of their inspiration to Mondrian in their classic purity. His long friendship with Miró and his own innate feeling for humor and fantasy soon led him to his characteristic free, organic shapes in terms of which he has made a thousand expressive variations, frequently continuing to combine them with geometric forms. He works now with an endless repertoire of organic and geometric shapes in the creation of mobiles and stabiles which are delicate, massive, humorous, menacing in turn, wires and flat shapes, black or brilliantly colored, encompassing space and shaping movement. (Nos. 43-50)

In recent years motion has become a central interest of artists in Europe and America. Experiments in the use of mechanical means for creating effects of movement are carried on continuously, as well as those wherein (as in Calder's mobiles) the delicate balance of the free elements causes them to move with the slightest breath of air. José de Rivera, in his beautifully and meticulously crafted constructions, uses movement as a frame rather than as a central part of the structure. His sculptures are thin sheets of steel or aluminum or brilliantly polished coils which encompass and shape space. As these slowly rotate on their bases, the effect is that of giving the spectator a gradual succession of completely integrated views. (Nos. 123-125)

The tradition of Brancusi and Arp has today few major followers in the United States. Of these the most important is Isamu Noguchi, whose works in all media—stone, metal, wood, clay—embody many different approaches, but maintain the consistent classic clarity of Brancusi combined with shapes of the Japanese ceramic tradition. (Nos. 351, 355) Of the younger sculptors, Rosati has until recently created in marble and bronze delicate and elegant figures which are personal variants of the tradition of Arp. He is now working in a still highly simplified but more massive idiom reminiscent of Freundlich and Wotruba. (Nos. 100-102)

The greatest single development in American sculpture during the last twenty years has been in the direction of direct metal sculpture, forged and welded; and lately in the cast bronze sculpture which incorporates ideas and elements from the constructivist tradition. The artists of this direction are many and varied in their approaches. Generally their sculpture is non-representational, but with strong suggestions of figures and subjects presented in specifically and forcefully expressive manner. Roszak, first a painter, became a geometric constructivist in the thirties, then in the forties developed his free form constructions of steel, brazed with bronze, brass, or nickel. These are romantic statements, rooted frequently in literature, powerful in structure, yet elegant in their incredibly varied textural surfaces. (Nos. 110, 111)

David Smith, who now works principally in steel, maintains a strongly architectural structure in both his more geometric works and in the freer sculptures that are rooted in a sense of living forms in landscape. (Nos. 116-121) Lipton, using hammered sheets of metal brazed with nickel and silver, creates organic forms that unfold like flowers or take on the strange shapes of

mythical beasts. (Nos. 246, 247) The problem of space has increasingly occupied Ferber, first in his cage and roofed structures and most recently in his great environmental sculptures into which the spectator can walk. (No. 153) Recently, sculptors of the direct metal school have been turning to bronze casting in "lost wax," frequently using techniques and forms of constructivism. Philip Pavia builds up his figures in wax on armatures of wood and cardboard which play an important part in the effect of the final bronze. (No. 360) David Slivka molds sheets of wax into undulating forms which present the thesis of sculpture as volume and space both abstractly and traditionally. (No. 415)

In America as in Europe, direct metal sculpture has now led to a wild outburst of 'found object' or 'junk' sculpture. The industrial society of the United States with its fantastic graveyards of wrecked automobiles or decaying machinery, lends itself to the symbolic interpretation inherent in the works of this school. Among them, Stankiewicz creates articulated figures in which the function of the original machine becomes integrated into the decrepit man-machine it has become. (No. 425) Julius Schmidt transforms machine parts into classical, balanced architectural bronzes in which the rust of the original takes on a new textural beauty. (No. 412)

The figurative school of sculpture has continued and increased in strength in recent years. Baskin, looking back to Barlach, creates obese little figures that are both defiant and pathetic, as well as owls that easily dominate the human figures. (Nos. 27-32) Glasco strangely suggests both Arp and Lachaise in inflated, highly polished bronze figures whose compressed features or pygmy heads foretell the death of the intellect. (Nos. 183-186) William King carries on the tradition of Nadelman in carved and bronze mannikins which are delightful satires on contemporary life and classic traditions. (Nos. 215, 216) The list of accomplished figure sculptors among the younger generation is long and growing. Their approach is dominantly satirical or bitterly critical of the world in which they live. Harold Tovish, in beautifully finished bronze, gives us a world of death's heads, torture victims, and the lost and isolated spectators who are mankind. (Nos. 427, 428)

The possibilities of wood as a sculptural material are being re-explored, not only by the figurative sculptors but also by carvers and constructivists working more abstractly. Raoul Hague for many years has shaped tree trunks into powerful semi-abstract forms which combine the living movement of the tree with sculptural structure of masses in space. (No. 196) Gabriel Kohn has developed geometric constructions of heavy wood strips glued together and shaped with the precision of machines. (No. 217) Louise Nevelson, using fragments of furniture, boxes, and balustrades, painted uniformly black or white or gold, has created great wall structures of overwhelming threatening power.

There are in the United States, as in any country, sculptors who defy classification. Joseph Cornell is unique unto himself, combining in his wonderful little boxes, elements of surrealism with American *trompe l'oeil*, to create an image at the same time naive and sophisticated. (Nos. 60-62)

These few comments have only touched on a number of the directions and interests of contemporary American sculpture in terms of a few of the leading or typical sculptors. Most of those represented in the exhibition and illustrated in this book could not even be mentioned, as the result of limitations of space. There are obviously a number of important sculptors not yet represented in the collection. The illustrations will indicate, however, the range and the vitality of American sculpture today. It only remains to say that we are living in the most vital and varied period in the history of American sculpture, the period in which this art has come of age, and the United States has taken her position as an international force.

BIOGRAPHIES AND CHECKLIST

PETER AGOSTINI

Born in New York City, 1913. Studied at Leonardo da Vinci Art School, New York. Numerous group exhibitions primarily in United States, including: *Aspects de la sculpture américaine*, Galerie Claude Bernard, Paris, 1960; *New Sculpture Group*, Stable Gallery, New York, 1960; sculpture show, Dwan Gallery, Los Angeles, 1961. One-man shows: Galerie Grimaud, New York, 1959; Stephen Radich Gallery, New York, 1960, 1962. Member, Faculty of Painting and Sculpture, Columbia University, 1961-62. Lives in New York City.

1. SARACEN 1215 A. D. 1960. Bronze, H. 29 $\frac{3}{4}$ ". Page 191

OLIVER ANDREWS

Born in Berkeley, California, 1925. Studied at University of Southern California, Los Angeles; Stanford University. 1948 began to study sculpture; visited Europe. First one-man exhibition, Santa Barbara Museum of Art, 1950. Exhibits in New York at Alan Gallery, most recently in 1961. Lives in Santa Monica, California.

2. SKY QUEEN. 1960. Steel, H. 20". Page 189

ALEXANDER ARCHIPENKO

Born in Kiev, 1887. 1902-05 studied at Kiev Art School. To Moscow, where he studied and exhibited, 1906. 1908 to Paris; attended École des Beaux-Arts. Founded his sculpture school, Paris, 1910. Associated with cubists and participated in their exhibitions, including *Section d'Or*, 1912. Represented in Armory Show, New York, 1913. Joined *Der Sturm*, Berlin, 1913. 1921-23, Berlin. Settled in United States, 1923. Has exhibited and taught extensively here at various schools including New Bauhaus, Chicago and his own school, New York. Most recent one-man exhibition in New York, Perls Galleries, 1962. Lives in New York City.

JEAN AUP

Born in Strasbourg, 1887. 1905-07 studied at Weimar Academy; 1908 at Académie Julian, Paris. 1909-11, Weggis, Switzerland, founded *Moderner Bund*. To Munich, 1911; joined *Blaue Reiter*. Met Kandinsky and Delaunay. To Berlin, 1913; member of *Der Sturm*. Association with Picasso, Max Jacob, Apollinaire. A founder of Dada movement with Hugo Ball and Tristan Tzara, Zürich, 1916; with Max Ernst, Cologne, 1919. 1922-26 lived mainly in Paris, where he joined surrealist movement. Active as painter, poet, graphic artist as well as sculptor. Contributor to many periodicals; among numerous publications are *Les Ismes de l'Art*, with Lissitzky, 1925; *Dreams and Projects*, 1952; sculpture for University of Caracas, 1953; relief for UNESCO Building, Paris, 1957. Recent major exhibitions include retrospective, The Museum of Modern Art, New York, 1958; *II. Documenta*, Kassel, 1959. Lives in Meudon, near Paris.

ERNST BARLACH

Born in Wedel, Germany, 1870. 1888-91 attended School of Applied Arts, Hamburg; 1891-95 studied sculpture at Dresden Academy, Paris, 1895-96, when he briefly attended Académie Julian. Traveled to Russia, 1906; to Florence, 1909. 1910 settled in Güstrow, Germany. Active as a graphic artist as well as sculptor; wrote many plays which he illustrated. Among his plays are *Der arme Vetter*, 1910; *Der Findling*, 1920; *Der blaue Boll*, 1923. Executed sculpture commissions for churches and memorials in Germany, including Güstrower Cathedral, 1927; Magdeburg Cathedral, 1929. Work declared "degenerate" by Hitler regime, 1937; some sculpture subsequently destroyed by Nazis. Died in Rostock, 1938.

PIERRE DONNARD

Born in Fontenay-aux-Roses, near Paris, 1867. Studied law; 1888-89 attended École des Beaux-Arts and Académie Julian, Paris. Met Denis, Vuillard, Sérusier. Joined *Nabi* group. First group exhibitions at Indépendants and Le Barc de Bouteville's, Paris, 1891. 1893 met Vollard who showed and published his book illustrations. First one-man show at Durand-Ruel's, Paris, 1896. Subsequently exhibited extensively throughout Europe and United States. 1926 visited United States as member of Pittsburgh International jury. Died at Le Cannet, 1947.

34. GIRL BATHING. c. 1923. Bronze, H. 10 $\frac{1}{2}$ ". Page 91

ÉMILE-ANTOINE BOUDELLE

Born in Montanban, France, 1861. Studied at École des Beaux-Arts, Toulouse. To Paris, 1885, attended École des Beaux-Arts where he studied with Falguière and Dalou, a pupil of Carpeaux. Entered Rodin's studio, worked there for many years as chief assistant. First exhibition, Galerie Hébrand, Paris, 1905. From 1909 taught in his studio, La Grande Chaumière. Public monuments include: *Monument for the Dead of 1870*, Montauban, 1902; bas reliefs for Théâtre des Champs-Élysées, Paris, 1912; Mickiewicz Monument, Paris. Died in Vésinet, near Paris, 1929.

CONSTANTIN BRANCUSI

Born in Pestisani Gorj, near Tarju-Jui, southern Rumania, 1876. Apprenticed to a carpenter; studied at Craiova, 1894-98; Bucharest Academy of Fine Arts, 1898-1902. 1902-04 to Paris, through Germany and Switzerland. Settled in Paris; studied at École des Beaux-Arts under Mercier. Refused invitation to work in Rodin's studio. From 1909 friendship with Modigliani. Represented in Armory Show, New York, 1913. Showed regularly at Salon des Indépendants, Paris, until 1920. 1921 met American collector John Quinn who purchased many of his works. Visited New York, 1926, 1934, 1939; India, 1937. Designed Temple of Deliverance for Maharajah of Indore (never executed). Retrospective The Solomon R. Guggenheim Museum, New York, 1955 (his first comprehensive museum exhibition). Died in Paris, 1957.

ALEXANDER CALDER

Born in Philadelphia, 1898. Studied engineering, Stevens Institute of Technology, Philadelphia, 1915-19. 1923-26 studied at Art Students League, New York. To Paris, 1926, where he developed his miniature circus. 1928 one-man exhibition of wire sculpture, New York. 1930 met Léger and Mondrian in Paris; joined *Abstraction-Création* group. 1932 first exhibited mobile sculpture in Paris, Galerie Vignon. Since 1933 has lived in Roxbury, Connecticut, making frequent trips to Paris. Settings for Satie's *Socrate*, 1936. Illustrated *The Fables of Aesop*, 1931; *Three Young Rats*, 1941, among others. Commissioned to design mobile for Terrace Plaza Hotel, Cincinnati, 1946. Among recent exhibitions: Brussels World's Fair, 1958; *H. Documenta*, Kassel, 1959.
